- c) Filters incoming traffic
- d) Stores user data

Correct Answer: b) Connects different networks

Explanation: A router is a device that connects multiple networks together, allowing them to communicate. It forwards data packets between devices on the same network or to other networks, such as the internet. By doing so, it enables devices to share resources and access the internet efficiently.

2. What does VLAN stand for?

- a) Variable Local Area Network
- b) Virtual Local Area Network
- c) Verified Local Area Network
- d) Visual Local Area Network

Correct Answer: b) Virtual Local Area Network

Explanation: VLAN stands for Virtual Local Area Network. It is a logical grouping of devices within a network that allows for segmentation without the need for physical separation. VLANs help improve network management, enhance security, and optimize performance by isolating traffic types.

- a) Network Application Transfer
- b) Network Allocation Tool
- c) Network Address Translation
- d) Network Access Technology

Correct Answer: c) Network Address Translation

Explanation: NAT stands for Network Address Translation. It is a method used in routers to translate private IP addresses to a public IP address. This allows multiple devices within a private network to share a single public IP address, which is essential for internet connectivity.

10. What is the function of a switch?

- a) Connects devices within a network
- b) Stores data files
- c) Extends Wi-Fi range
- d) Filters internet traffic

Correct Answer: a) Connects devices within a network

Explanation: A switch is a networking device that connects multiple devices within a local area network (LAN). It uses MAC addresses to forward data only to the device that needs it, optimizing network performance and reducing unnecessary traffic, which is crucial for efficient communications.

11. What protocol is used for secure communication?

- a) HTTPS
- b) HTTP
- c) SMTP
- d) FTP

Correct Answer: a) HTTPS

Explanation: HTTPS, or Hypertext Transfer Protocol Secure, is used for secure communication over a computer network. It encrypts data exchanged between a web browser and a server, ensuring that sensitive information, such as passwords and personal data, remains confidential and protected from eavesdropping.

12. Which device amplifies network signals?

- a) Switch
- b) Repeater
- c) Hub
- d) Router

Correct Answer: b) Repeater

Explanation: A repeater is a device that amplifies and regenerates network signals to extend the range of a network. It receives weak signals, strengthens them, and transmits them further, which is essential for maintaining connection quality over long distances in a network installation.

13. How does VLAN improve performance?

- a) Boosts internet speed
- b) Reduces IP addresses
- c) Segments network traffic
- d) Increases device connections

Correct Answer: c) Segments network traffic

Explanation: VLANs improve performance by segmenting network traffic into different logical networks. This segmentation reduces broadcast domains, lowers congestion, and enhances overall network efficiency. By isolating traffic types, VLANs ensure that sensitive data remains secure and improves response times.

14. What is the primary purpose of a firewall?

- a) Increases internet speed
- b) Protects against unauthorized access
- c) Connects different networks
- d) Manages IP addresses

Correct Answer: b) Protects against unauthorized access

Explanation: The primary purpose of a firewall is to protect a network from unauthorized access and threats. It acts as a barrier between a trusted internal network and untrusted external networks, filtering incoming and outgoing traffic based on predetermined security rules.

15. What does ping test for?

- a) Network connection status
- b) Device compatibility
- c) Signal strength
- d) Bandwidth speed

Correct Answer: a) Network connection status

Explanation: A ping test checks the status of a network connection by sending a packet of data to a specific IP address and waiting for a response. This helps Network Installation determine if a device is reachable over the network and assesses network latency and reliability.

16. Which cable is used for internet connection?

- a) Fiber optic cable
- b) USB cable
- c) Ethernet cable
- d) Coaxial cable

Correct Answer: c) Ethernet cable

Explanation: An Ethernet cable is commonly used for wired internet connections in networking.
